

Three new digital assistants from SimasiaAI:

WORKING WITH PATIENT ORGANIZATIONS TO SUPPORT VULNERABLE SOCIAL GROUPS

SimasiaAI recently introduced three new digital assistants for vulnerable social groups, developed in close collaboration with patient organizations:

SKP-i, developed with the Hellenic Federation of Persons with Multiple Sclerosis (POAmSKP); Myrto, developed with the Cancer Guidance Center – Kapa3; and BPAN Companion, an assistant available in 60 languages for the rare neurodegenerative disorder BPAN (Beta-Propeller Protein-Associated Neurodegeneration), developed with BPAN Heroes.

These assistants provide reliable information about the specific conditions, as well as the benefits, services and rights available to patients.

They serve as a valuable hub, bringing together scattered information and communicating it to anyone concerned in a caring and inclusive manner.

In addition, these digital assistants can recognize emotions and detect whether a person is experiencing a crisis that requires immediate human intervention, directing them to the appropriate support.

All three assistants were developed through close and systematic collaboration with the respective patient organizations, which actively participated in every stage of the design process.

SimasiaAI established the framework for the collaboration, while POAmSKP, Kapa3 and BPAN Heroes contributed their invaluable expertise in identifying reliable sources—including scientific publications, legal documents and official service circulars—and actively helped shape the content.

Members of these organizations—people with lived experience of the conditions and caregivers—tested the assistants, identified gaps or inaccuracies, suggested corrections, helped refine the tone and vocabulary, and shared their extensive experience. This ensured that the information reflects the real-life experiences and needs of patients and their caregivers.

SimasiaAI addressed every piece of feedback, established safeguards to ensure that the assistants provide only reliable answers, equipped them with accessibility features, emotion-recognition capabilities and guidance for moments of crisis, and tailored them to the specific goals of each organization.

In this way, the wealth of knowledge that patient organizations have about their communities is no longer constrained by their limited human resources. Tailored precisely to their needs, these digital assistants are available around the clock, significantly expanding the organizations' valuable social impact.
